

CLAIMS

50B 1. A papermaking mold which comprises a papermaking part of a prescribed shape, a peripheral part extending outward from the peripheral edge of said papermaking part, and a net covering said papermaking part and at least part of said peripheral part, wherein a fixing member is disposed on the periphery of said net, and said fixing member is fixed to said peripheral part to fix said net by said fixing member.

2. The papermaking mold according to claim 1, wherein said fixing member is integrally fixed to the part of said net that covers said peripheral part.

10 3. The papermaking mold according to claim 1, wherein said fixing member has a mating projection which fits in a mating depression made on said peripheral part to fix said fixing member to said peripheral part.

4. The papermaking mold according to claim 1, which is used as paired with another one in such a manner that the papermaking parts of the pair face each other and the fixing members of the pair are brought into contact with each other.

15 5. The papermaking mold according to claim 1, which is used as paired with another one in such a manner that the papermaking parts of the pair face each other so that said papermaking parts form a cavity of a prescribed shape in which a pulp slurry is to be injected to deposit pulp fiber on said net.

20 6. A papermaking mold which comprises a papermaking part of a prescribed shape, a peripheral part extending outward from said papermaking part, and a papermaking net covering said papermaking part and at least part of said peripheral part, wherein said part of the net which covers said peripheral part is disposed in the site where it does not receive a mold clamping force or it is not damaged by a mold clamping force.

25 7. The papermaking mold according to claim 6, wherein said site of said peripheral

part where said part of the net which covers said peripheral part is to be disposed is lower than a surface on which a mold clamping force is to be exerted by a certain level difference.

8. The papermaking mold according to claim 6, which has a means for adjusting a mold clamping force.

9. The papermaking mold according to claim 6, wherein a sealing member is provided on said surface on which a mold clamping force is to be exerted.

10. The papermaking mold according to claim 6, wherein an auxiliary sealing member or a mold clamping force buffering member is provided on said part of the net which covers said peripheral part or on said site of disposition.
